A: If you want to "smooth" the result (if it gets a little rough), you could use a pixellate command like this: `/reptile 22/- -rfactor-blancpain-series-2012-sp12-tracks-fitgirl-repackl -s 6 -w 6 -h 6 -x 100 -y 100 -t - -b -v` The reptile command looks like this: `/reptile [][][]` There's a bunch of ways to create the file size, you can use the "Auto" button, which will give you an approximation of the size, but usually is close enough for our purposes. The numbers after the file size parameter are just how many times the command will iterate on the image, you can set them to whatever you'd like. The whole command looks like this: `/reptile 22/- -rfactor-blancpain-series-2012-sp12-tracks-fitgirl-repackl -s 6 -w 6 -h 6 -x 100 -y 100 -t - -b -v` You can find a very detailed explanation of the command here. If you want to check out a tutorial on this specific command, I'd recommend you check out Jeff's answer here. He discusses all the different parameters for the command.

The distribution of metals and organic chemicals (OCs) in terrestrial and aquatic ecosystems is becoming increasingly important as they can have major environmental, human health, and economic consequences. While data exist on contamination by some metals and OCs, data on environmental fate, transport, and bioavailability are not generally available for most of the metals or OCs of concern. The North Carolina State University (NCSU) research team will be a participant in the Environmental Monitoring and Assessment of Southeastern U.S. National Human Health and Environmental Monitoring Program (META/SHIELD) project. The specific aims of the project are to provide data on the occurrence and fate of metal and OC contaminants in the coastal zone of North Carolina. Laboratory studies will be used to determine the environmental distribution and transport of metals and OCs. The primary sampling locations will be in the coastal zone of North Carolina, with emphasis on the rivers, lakes, and marine sediments of the coastal plain. In addition, air, water, and soils will be collected in North Carolina 2d92ce491b
