It is located in the village of Fuglsang. It is the main church for the Fuglsang parish which is part of the Ofoten prosti (deanery) in the Diocese of Sør-Hålogaland. The white, stone church was built in a long church style in 2002 by the architect Kaare Christian Foseid. The church seats about 130 people. History The earliest existing record of the church is from a church book from the year 1310. It mentions the first rector at Fuglsen, the year of the church's foundation, and a baptism record from 1403. The church was likely built around then. The church was completely renovated around 1798, and the church was raised to the status of a parish in 1898. In 2002, the church was renovated with new heating, lighting, and air conditioning. There have been two bell towers at the Fuglsang church, one since the early 1900s and one added in 2001. The newer bell tower is tall. Ratiometric fluorescent probes based on the repair enzyme thymine DNA glycosylase (TDG) have been widely used for the sensing of nucleic acids, but the TDG-based sensor cannot discriminate dioxin from other pollutants. Herein, we show that a simple DNA probe can be used to detect dioxin based on the repair enzyme TDG. The resulting biosensor can detect dioxin with a high sensitivity of 4 nM and a linear detection range of 1-1000 nM
