I want to try to decode the string and print the content using Python. What I have tried so far? I have tried regex: regex=re.findall('eplanelectricp819validationcode (.*) ',text) But this returns nothing. regex=re.findall(' eplanelectricp819validationcode (.*) ',text) I have tried to use strip() function to strip out the tag that surrounded Also, I have used line.replace(' ','') to strip out tag, but still it didn't return anything. Is there any better way? import re text='something ' regex=re.findall('eplanelectricp819validationcode (.*) ',text) print(regex) regex=re.findall(' eplanelectricp819validationcode (.*) ',text) print(regex) regex=re.findall(' eplanelectricp819validationcode (.*) ',text.strip()) print(regex) regex=re.findall(' eplanelectricp819validationcode (.*) ',text.strip().replace(' ','')) print(regex) A: The data you have given is not valid: Example that have been given by you: eplanelectricp819validationcode eplanelectricp819validationcode eplanelectricp819validationcode eplanelectricp819validationcode so this is why we need to do something like this: import re text=""something eplanelectricp819validationcode eplanelectricp819validationcode eplanelectricp819validationcode eplanelectricp819validationcode eplanelectricp819validationcode eplanelectricp819validationcode eplanelectricp819valid
